GEOG 1180 Introduction to Geo-Programming

Assignment 3   Summation

In this assignment, you will write a script to compute a summation of a series of input integers.

Here are the requirements for this assignment:

1) Write a while-loop that asks the user to input integers one by one until the user inputs "End". When the loop stops, print the summation of the input integers. (3.5 points) (Hint: the stop condition is the input == 'End').
2) The input is considered valid if it is an integer. Any other input is considered to be invalid (e.g. 2.75). If the input is invalid, print "Error" and ask the user to input a new number. (3.5 points)

Please submit a Python script to Canvas for this assignment before the due date.
